

OPERATIONS HANDOFF NOTES | REDUNDANCY TEST

Incident summary

The payments queue reached 82% utilization at 14:20 UTC. The team increased worker capacity from 12 to 20 and queue utilization returned below 50% within 11 minutes.

Incident summary duplicate

The payments queue reached 82% utilization at 14:20 UTC. The team increased worker capacity from 12 to 20 and queue utilization returned below 50% within 11 minutes.

Incident summary near duplicate

At 14:20 UTC, payments queue utilization hit 82 percent. Worker capacity rose from twelve to twenty and utilization dropped under 50 percent after eleven minutes.

Customer impact

Twenty-seven checkout attempts were delayed, but no payments were lost. Customer support used the incident response macro PAY-QUEUE-DELAY.

Resolution

The permanent fix is to add an autoscaling alert at 70% queue utilization and review the worker maximum during the next capacity planning meeting.

Resolution duplicate

The permanent fix is to add an autoscaling alert at 70% queue utilization and review the worker maximum during the next capacity planning meeting.
